

Ful-FAQ

created from prehistoric plant material

Why is Ful-Power important for my plants? Fulvic is a missing link in most plant systems, especially container and hydroponic gardening. It will give even the best system that ultimate boost.

How will my plants benefit from using Ful-Power? Expect to see greater root formation, increased nutrient absorption, and healthier plants all of which leads to better yields. You will also notice better tasting produce and more aromatic flowers. Ful-Power minimizes stress from excess heat, frost, and other environmental pressures.

Is Ful-Power compatible with all nutrients? Ful-Power is completely compatible with all nutrients. Ful-Power is a true fulvic acid isolate. Our unique cold-microbial process (fermentation) creates a true biostimulant free from nuisance chemicals, that is much more effective than crude water-leached products. There are no fillers, preservatives or other nutrients. Plus, unlike any other fulvic product, there are additional phytostimulants and enzymes, which come from the fermentation process.

Is Ful-Power compatible with my system? Ful-Power works in harmony with all types of systems. Because it's purified by a biodigestion it will not clog, gel, gum up, or clump. It can be used in soil, hydroponic, aqua-culture, large scale farm, irrigation, horticulture, sand beds, drip systems, precision jet systems, remediation, compost tea...let's just say we have not found a system where it's not compatible.

Does Ful-Power effect my pH? Ful-Power fulvic acid has little to no effect on your nutrient pH when diluted. In fact, it acts as a pH buffer and will not effect pH negatively.

Does Ful-Power effect my ppm? Ful-Power will not effect ppm in any noticeable way. This means you do not need to compensate for unwanted nutrient value and the product can be integrated into your existing program with ease.

Can I use Ful-Power when I foliar feed? Ful-Power is a must with all foliar applications as it helps the other components penetrate into the cells, amplifies their effects and improves efficiency. Follow label instructions on the bottle.

Can I mix Ful-Power with my pesticide spray? Ful-Power will increase the efficacy of many pesticides. When using pesticides consider reducing application rates by 1/4-1/3 on average.

Can I use Ful-Power on cuttings? Ful-Power is excellent when used on cuttings. Improved speed and development may be achieved. More importantly, the new plants will experience less stress and improved health. A healthier cutting leads to healthier plants and increased genetic potential. Follow label instructions.

Can I use Ful-Power on seeds? Like cuttings, Ful-Power is excellent when used to start seeds. Improved speed and development may be achieved. More importantly, the new plants will experience less stress and improved health. Follow label instructions.

Can I use Ful-Power if I want to grow organically? Ful-Power is as natural as it gets. It's listed by OMRI and meets all NOP standards.

Does Ful-Power expire or go bad? Ful-Power fulvic is completely stable and will not degrade on the shelf. It's stamped with an expiration date two years from date of bottling, but it's already 2 million years old. If stored in light, it may grow blue-green algae, but this will not cause harm to the product or your system.
